## Design Of Coal Preparation Plants

Addressing coal research and design is an important stage in construction and operation of coal preparation plants. At present time the calculation of flow sheets is based on the initial data of the study of operational samples (industrial) samples, taken directly from the mine (open cast) without taking into account breakage on handling of coal from the mine (open cast) to the coal preparation plant.

The design of the Phola coal preparation has its roots in the late 1980s when there was a

requirement for a plant to treat 8 Mtpa coal from Ingwe's (now BECSA's) adjacent Klipspruit opencast mine at Ogies, Mpumalanga. The mine is part of the South African Witbank Coalfield and accesses the No. 2 and 4 Seams with some 5 Seam material.

A coal preparation plant is a facility that washes coal of soil and rock, crushes it into graded sized chunks, stockpiles grades preparing it for transport to market, and more often than not, also loads coal into rail cars, barges, or ships. The more of this waste material that can be removed from coal, the lower its total ash content, the greater its market value and the lower its transportation costs.
