Overview. The propagation of waves along and across the boundary between two media with different characteristic velocities is much more complicated when the source is on or near the boundary than when it is far away and the incident waves are plane. Examples of waves generated by localized sources near a boundary are the electromagnetic waves from the currents in a dipole on the surface of the earth and the seismic waves from a slip event in a fault in the earth's crust like the San Andreas ...

Abstract: Lateral electromagnetic waves along a plane boundary between homogeneous half-spaces are reviewed. The electromagnetic fields generated by vertical and horizontal electric dipoles near the boundary between air and the earth (salt or fresh water, soil, ice, etc.) are summarized in terms of a new unified theory of lateral-wave propagation.

Later on, the simultaneous, but separate discoveries made by Michael Faraday and Joseph Henry concerning electromagnetic induction in the 1830's led to the theory of James Clerk Maxwell, which united electricity, magnetism, and optics into one grand theory of light: the explanation of electromagnetic waves.

ELECTROMAGNETIC WAVE THEORY - Purdue University

It alternates in direction (red for up, blue for down) making a wave, and carries with it a magnetic field and electromagnetic energy. The electromagnetic wave disturbs the electric field at any point through which it passes. It therefore moves the charges in the metal loop, causing a current.
